Retirement Board
City of Battle Creek
Police and Fire Retirement System
Battle Creek, Michigan

Dear Board Members:

The results of the June 30, 2018 Annual Actuarial Valuation of the City of Battle Creek Police and Fire Retirement System are presented in this report.

This report was prepared at the request of the Board and is intended for use by the Retirement System and those designated or approved by the Board. This report may be provided to parties other than the System only in its entirety and only with the permission of the Board. GRS is not responsible for unauthorized use of this report.

The purposes of the valuation are to measure the System's funding progress and to determine the employer contribution rate for the fiscal year ending June 30, 2020. Information required by Statement Nos. 67 and 68 of the Governmental Accounting Standards Board (GASB) are provided in separate reports. This report should not be relied on for any purpose other than the purposes described herein. Determinations of financial results, associated with the benefits described in this report, for purposes other than those identified above may be significantly different.

The contribution amount in this report is determined using the actuarial assumptions and methods disclosed in Section C of this report. This report includes risk metrics on page A-18 but does not include a more robust assessment of the risks of future experience not meeting the actuarial assumptions. Additional assessment of risks was outside the scope of this assignment. We encourage a review and assessment of investment and other significant risks that may have a material effect on the System's financial condition.

This valuation assumed the continuing ability of the plan sponsor to make the contributions necessary to fund this plan. A determination regarding whether or not the plan sponsor is actually able to do so is outside our scope of expertise and was not performed.

The findings in this report are based on data and other information through June 30, 2018. The valuation was based upon information furnished by the City, concerning Retirement System benefits, financial transactions, plan provisions and active members, terminated members, retirees and beneficiaries. We checked for internal reasonability and year-to-year consistency, but did not audit the data. We are not responsible for the accuracy or completeness of the information provided by the City.

This report was prepared using assumptions adopted by the Board. All actuarial assumptions used in this report are reasonable for the purposes of this valuation.

This report has been prepared by actuaries who have substantial experience valuing public employee retirement systems. To the best of our knowledge the information contained in this report is accurate and fairly presents the actuarial position of the City of Battle Creek Police and Fire Retirement System as of the valuation date. All calculations have been made in conformity with generally accepted actuarial principles and practices and with the Actuarial Standards of Practice issued by the Actuarial Standards Board.

Abra D. Hill, Derek Henning and Heidi G. Barry are Members of the American Academy of Actuaries (MAAA). These actuaries meet the Academy's Qualification Standards to render the actuarial opinions contained herein.

The signing actuaries are independent of the plan sponsor.

Gabriel, Roeder, Smith & Company will be pleased to review this valuation and report with the Board of Trustees and to answer any questions pertaining to the valuation.

Respectfully submitted,

Abra D. Hill, ASA, MAAA

Abra D. Hill

Derek Henning, ASA, MAAA

Heidi G. Barry, ASA, FCA, MAAA

SECTION A

VALUATION RESULTS, COMMENTS, RECOMMENDATIONS, AND CONCLUSIONS

Financial Objective

The financial objective of the Retirement System is to establish and receive contributions, expressed as percents of active member payroll, which will remain approximately level from year to year and will not have to be increased for future generations of citizens. This objective meets the requirements of Act No. 345 of the Public Acts of 1937, as amended, and the Michigan constitution.

Contribution Rates

The Retirement System is supported by member contributions, City contributions and investment income from Retirement System assets.

Contributions which are intended to satisfy the financial objective are determined by an annual actuarial valuation and are sufficient to:

- (1) cover the actuarial present value of benefits assigned to the current year by the actuarial cost methods described in Section C (the normal cost); and
- (2) amortize over a period of future years the actuarial present value of benefits not covered by valuation assets and anticipated future normal costs (unfunded actuarial accrued liability).

Computed contributions for the fiscal year beginning July 1, 2019 are shown on page A-2.

Contributions Computed to Meet the Financial Objective of the Retirement System

Contributions for	Contributions Expressed as Percents-of-Payroll				
Fiscal Year Beginning July 1	2019	2018			
Normal Cost					
Age and service benefits	23.34 %	23.39 %			
Death and disability benefits	1.55 %	1.55 %			
Termination benefits					
Deferred age & service benefits	2.09 %	2.06 %			
Refunds of member contributions	0.51 %	0.51 %			
Total Normal Cost	27.49 %	27.51 %			
Amortization Payment/(Credit)	17.02 %	15.69 %			
Total Contribution Requirement	44.51 %	43.20 %			
Less average member portion	9.90 %	9.84 %			
City portion	34.61 %	33.36 %			

Please refer to page C-6 for information on the determination of the amortization payment.

A procedure for determining dollar contribution amounts is described on page A-3.

Comparative contribution amounts for prior fiscal years are shown on page A-6.

Determining Dollar Contributions

For any period of time, the percent-of-payroll contribution rate needs to be converted to dollar amounts. We recommend the following procedure.

Contribute dollar amounts at the end of each payroll period which are equal to the City's percent-ofpayroll contribution requirement 34.61% multiplied by the covered active member payroll for the period. Adjustments should be made as necessary to exclude items of pay that are not covered compensation for Retirement System benefits and to include special payments that are covered compensation (overtime, longevity pay, etc.).

The above amounts are assumed to be contributed, on average, halfway through the fiscal year. If contributions are made on a later schedule, interest should be added at the rate of 0.53% for each month of delay.

- * After changes in actuarial assumptions or methods.
- # After changes in benefit provisions.
- (a) From 1980 to 1986, total payroll for Retirement System purposes was projected to be 107% of reported payroll (base pay). This was done because of the inclusion of overtime and longevity pay in gross pay for Retirement System purposes.
- ^ Prior to the 6/30/2006 valuation, actuarial present value of credited projected benefits was used.
- + Retirement System is fully funded on a credited projected benefit basis.
- @ Assets shown are net of health assets beginning in 1994.

Short Condition Test - Comparative Statement

The Short Condition Test is another way of looking at a system's progress under its funding program based on the entry-age accrued liability. In a short condition test, the plan's valuation assets are compared with: 1) Active member contributions on deposit; 2) The liabilities for future benefits to present retired lives; and 3) The liabilities allocated to service already rendered by active members. In a system that has been following the discipline of level percent-of-payroll financing, the liabilities for active member contributions on deposit (liability 1) and the liabilities for future benefits to present retired lives (liability 2) will be fully covered by valuation assets (except in rare circumstances). In addition, the liabilities assigned to service already rendered by active members (liability 3) will be partially covered by the remainder of the valuation assets. The larger the funded portion of liability 3, the stronger the condition of the system. Liability 3 being fully funded is uncommon.

The following schedule illustrates the history of liabilities 1, 2 and 3.

	Actuarial Accrued Liability ^

G4. Funding Value End of Year	\$131,757,916	\$135,407,676	\$140,243,417	\$ 145,748,585					
H. Difference between Market & Funding Value: B-G4	2,092,518	(3,358,683)	(1,734,081)	(1,160,125)					
I. Recognized Rate of Return	8.81%	6.06%	7.33%	6.77%					
J. Market Rate of Return	3.44%	1.82%	8.78%	7.28%					

The Funding Value of Assets recognizes assumed investment income (line E3) fully each year. Differences between actual and assumed investment income (line E4) are phased-in over a closed five-year period. During periods when investment performance exceeds the assumed rate, Funding Value of Assets will tend to be less than Market Value. During periods when investment performance is less than the assumed rate, Funding Value of Assets will tend to be greater than Market Value. The Funding Value of Assets is **unbiased** with respect to Market Value. At any time it may be either greater or less than Market Value. If actual and assumed rates of investment income are exactly equal for four consecutive years, the Funding Value will become equal to Market Value.

Sources of Funds

Derivation of Actuarial Gain (Loss) Year Ended June 30

The actuarial gains or losses realized in the operation of the Retirement System provide an experience test. Gains and losses are expected to cancel each other over a period of years (in the absence of double-digit inflation) and sizable year-to-year fluctuations are common. Details of the derivation of the actuarial gain (loss) are shown below, along with a year-by-year comparative schedule.

	2018	2017
(1) UAAL* at start of year	\$ 44,408,781	\$ 36,531,210
(2) Employer normal cost	2,512,051	2,365,444
(3) Actual employer contributions	4,680,487	4,228,234
(4) Interest accrual	2,816,097	2,402,988
(5) Expected UAAL before changes: (1) + (2) - (3) + (4)	45,056,442	37,071,408
(6) Changes due to plan amendments	(111,600)	1,322,624
(7) Changes due to revised assumptions or methods	0	4,645,879
(8) Expected UAAL after changes	44,944,842	43,039,911
(9) Actual UAAL at end of year	47,166,343	44,408,781
(10) Gain (loss): (8) - (9)	(2,221,501)	(1,368,870)
(11) Gain (loss) as a percent of actuarial accrued		
liabilities at start of year (\$184,652,198)	(1.2%)	(0.8%)

^{*} Unfunded actuarial accrued liability.

Valuation	Actuarial Gain (Loss)
Date	as % of Beginning
June 30	Accrued Liabilities
2009	(4.7)%
2010	(2.4)%
2011	(0.1)%
2012	(3.5)%
2013	0.1 %
2014	2.0 %
2015	0.6 %
2016	0.0 %
2017	(0.8)%
2018	(1.2)%

Comments, Recommendations and Conclusions

Experience: Investment experience on a market value basis for the year ended June 30, 2018 was favorable with a market rate of return of 7.28% (versus the expected return of 6.5%). On a funding value basis, investment gains as of June 30, 2018 totaled \$374.1 thousand. Overall experience from 2017-2018 was less favorable than expected. This is primarily due to more retirements than expected (11 actual vs. 5.3 expected) and higher pay increases than expected.

Expected Computed Contribution Rates in Future Years: The method used to derive valuation assets will, over the long-term, produce rates of return equal to those measured on a pure market value basis. This means that over the long term, total employer contributions are not expected to be impacted by the method used to derive valuation assets. This relationship does not hold over the short term; valuation assets may drop to 80% of market value or go up to 120% of market value. Valuation assets are now approximately \$1.2 million higher than the market value, with approximately \$2.0 million of investment losses still to be recognized during the next two years. Recognition of these losses over the next two years is expected to put upward pressure on employer contribution rates (in the absence of significant investment gains).

Post-Retirement Health Care Benefit: Contributions made to the retiree health portion of the fund must meet certain requirements specified in IRC 401(h). Page A-14 of this report provides information regarding the required subordination test.

Please note the following:

- Even if contributions equal to the limit are made, they would not be expected to be sufficient to meet the ongoing post-retirement health care costs.
- As long as post-retirement health care payments made from the Retirement System do not
 exceed the Reserve for Health Care balance, the decision to either levy any money or make any
 contributions to cover post-retirement health care through the Retirement System remains a
 policy decision.

Amortization Method: The current method for amortizing Unfunded Actuarial Accrued Liability (UAAL) is a level percent of pay approach over a closed period of 30 years beginning July 1, 2015 and ending June 30, 2045 (26 years remaining as of the June 30, 2018 valuation, which determines the fiscal year 2020 contribution). Benefit changes and assumption changes are separately amortized over 30 years as they occur. Absent actuarial gains or losses, a closed amortization period is expected to result in UAAL amortization payments that remain level as a percentage of payroll.

Benefit Changes: The following new benefit provisions were reported for this valuation:

• Police Lieutenants: Deferred Retirement Option Plan (DROP) adopted and effective 7/1/16

These provisions are reflected for the first time in the June 30, 2018 valuation.

Comments, Recommendations and Conclusions

Public Act 202: Public Act 202 (PA 202) was signed into law December 20, 2017 and requires local units of government to electronically submit Form 5572 to the Michigan Department of Treasury (DOT) on an annual basis to evaluate the funded status of the retirement pension system. The local unit of government is considered underfunded if the actuarial accrued liability of a retirement pension system is less than 60% funded, and if the annual required contribution for all of the retirement systems of the local unit of government is greater than 10% of annual general fund operating revenues. An underfunded local unit of government is required to develop and submit for approval a corrective action plan for the local unit of government.

The Michigan State Treasurer has established uniform actuarial assumptions as required by PA 202 for use with the annual Form 5572 (Retirement System Annual Report). The use of the uniform assumptions for reporting will be required for the 2019 fiscal year (note that the Department of Treasury is encouraging early adoption).

We would be happy to discuss with the Board options for fulfilling the reporting requirements. Fees associated with these reporting requirements would be based on the complexity of the assignment.

Conclusion: The Retirement System's financial objective is to meet long-term benefit obligations through contributions that remain approximately level from year to year as a percent of active member payroll. Continued receipt of these contributions is the best guarantee that the Plan will be able to pay all promised benefits when due.

Other Observations

General Implications of Contribution Allocation Procedure or Funding Policy on Future Expected Contributions and Funded Status

Given the System's contribution allocation procedure, if all actuarial assumptions are met (including the assumption of the Retirement System earning 6.50% on the Market Value of Assets), it is expected that:

- 1. The employer normal cost is sufficient to cover the cost of benefits accruing each year;
- 2. The Unfunded Actuarial Accrued Liabilities (UAAL) will continue to be amortized; and
- 3. The funded status of the Retirement System will continue to increase gradually towards a 100% funded ratio.

Limitations of Funded Status Measurements

Unless otherwise indicated, a funded status measurement presented in this report is based upon the Actuarial Accrued Liability (AAL) and the Funding Value of Assets (FVA). Unless otherwise indicated, with regard to any funded status measurements presented in this report:

- 1. The measurement is inappropriate for assessing the sufficiency of Retirement System assets to cover the estimated cost of settling the Retirement System's benefit obligations, for example: transferring the liability to an unrelated third party in a market value type transaction.
- 2. The measurement is dependent upon the Actuarial Cost Method which, in combination with the Retirement System's amortization policy, affects the timing and amounts of future contributions. The amounts of future contributions will most certainly differ from those assumed in this report due to future actual experience differing from assumed experience based upon the actuarial assumptions. Even if the funded status measurement in this report was 100%, it would not be synonymous with no required future contributions. The Retirement System would still require future normal cost contributions (i.e., contributions to cover the cost of active membership accruing an additional year of service credit).
- 3. The measurement would produce a different result if the Market Value of Assets (MVA) were used instead of the FVA, unless the MVA is used in the measurement.

Limitations of Project Scope

Actuarial standards do not require the actuary to evaluate the ability of the plan sponsor or other contributing entities to make required contributions to the plan when due. Such an evaluation was not within the scope of this project and is not within the actuary's domain of expertise. Consequently, the actuary performed no such evaluation.

Risks to Future Employer Contribution Requirements

There are ongoing risks to future employer contribution requirements to which the Retirement System is exposed, such as:

Actual <u>and</u> Assumed Investment Rate of Return Actual <u>and</u> Assumed Mortality Rates Amortization Policy

Risk Measures - Risks Associated with Measuring the Accrued Liability and Actuarially Determined Contribution

The determination of the accrued liability and the actuarially determined contribution requires the use of assumptions regarding future economic and demographic experience. Risk measures, as illustrated in this report, are intended to aid in the understanding of the effects of future experience differing from the assumptions used in the course of the actuarial valuation. Risk measures may also help with illustrating the potential volatility in the accrued liability and the actuarially determined contribution that result from the differences between actual experience and the actuarial assumptions.

Future actuarial measurements may differ significantly from the current measurements presented in this report due to such factors as the following: plan experience differing from that anticipated by the economic or demographic assumptions; changes in economic or demographic assumptions due to changing conditions; increases or decreases expected as part of the natural operation of the methodology used for these measurements (such as the end of an amortization period, or additional cost or contribution requirements based on the System's funded status); and changes in plan provisions or applicable law. The scope of an actuarial valuation does not include an analysis of the potential range of such future measurements.

Examples of risk that may reasonably be anticipated to significantly affect the plan's future financial condition include:

- 1. Investment risk actual investment returns may differ from the expected returns;
- Asset/Liability mismatch changes in asset values may not match changes in liabilities, thereby
 altering the gap between the accrued liability and assets and consequently altering the funded
 status and contribution requirements;
- Contribution risk actual contributions may differ from expected future contributions. For
 example, actual contributions may not be made in accordance with the plan's funding policy or
 material changes may occur in the anticipated number of covered employees, covered payroll, or
 other relevant contribution base;
- 4. Salary and Payroll risk actual salaries and total payroll may differ from expected, resulting in actual future accrued liability and contributions differing from expected;
- 5. Longevity risk members may live longer or shorter than expected and receive pensions for a period of time other than assumed; and
- 6. Other demographic risks members may terminate, retire or become disabled at times or with benefits other than assumed resulting in actual future accrued liability and contributions differing from expected.

The effects of certain trends in experience can generally be anticipated. For example, if the investment return since the most recent actuarial valuation is less (or more) than the assumed rate, the cost of the plan can be expected to increase (or decrease). Likewise, if longevity is improving (or worsening), increases (or decreases) in cost can be anticipated.

The computed contribution shown on page A-2 may be considered as a minimum contribution rate that complies with the Board's funding policy. The timely receipt of the actuarially determined contributions is critical to support the financial health of the plan. Users of this report should be aware that contributions made at the actuarially determined rate do not necessarily guarantee benefit security.

^{*} Revised actuarial assumptions.

- (5). The funded ratio is the most widely known measure of a plan's financial strength, but the trend in the funded ratio is much more important than the absolute ratio. The funded ratio should trend to 100%. As it approaches 100%, it is important to re-evaluate the level of investment risk in the portfolio and potentially to re-evaluate the assumed rate of return.
- (6) and (7). The ratio of retiree liabilities to total accrued liabilities gives an indication of the maturity of the system. As the ratio increases, cash flow needs increase, and the liquidity needs of the portfolio change. A ratio on the order of 50% indicates a maturing system.
- (8) and (9). The ratio of liabilities and assets to payroll gives an indication of both maturity and volatility. Many systems have ratios between 500% and 700%. Ratios significantly above that range may indicate difficulty in supporting the benefit level as a level % of payroll.
- (10) The ratio of unfunded liability to payroll gives an indication of the plan sponsor's ability to actually pay off the unfunded liability. A ratio above approximately 300% or 400% may indicate difficulty in discharging the unfunded liability within a reasonable time frame.
- (11) and (12). The ratio of Non-Investment Cash Flow to assets is an important measure of sustainability. Negative ratios are common and expected for a maturing system. In the longer term, this ratio should be on the order of -2% to -3% based upon current plan assumptions. A ratio that is significantly more negative than that for an extended period could be a leading indicator of potential exhaustion of assets.
- (13) and (14). Investment return is probably the largest single risk that most systems face. The year-by-year return and the five-year geometric average both give an indication of the reasonableness of the system's assumed return. Of course past performance is not a guarantee of future results. Market rate shown is based on actuarial estimation method and will differ modestly from figures reported by the investment consultant.

Brief Summary of Act 345 Benefit Conditions Evaluated (Updated to June 30, 2018)

ELIGIBILITY AMOUNT

SERVICE RETIREMENT

The benefit amounts attributable to regular retirements and the conditions under which such benefits may be paid are described in tabular form on page B-2.

DEFERRED RETIREMENT

Termination of employment after 10 or more years of service.

Computed as service retirement but based upon service, Average Final Compensation (AFC) and benefit in effect at termination. Benefit begins at date retirement would have occurred had member remained in employment.

DEATH AFTER RETIREMENT SURVIVOR'S PENSION

Payable to a surviving spouse, if any, upon the death of a retired member who was receiving a straight life pension which was effective July 1, 1975 or later.

Spouse's pension equals 60% of the straight life pension the deceased retiree was receiving.

NON-DUTY DEATH-IN-SERVICE SURVIVOR'S PENSION

Payable to a surviving spouse, if any, upon the death of a member with 20 or more years of service, or a Police member with 10 or more years of service.

Accrued straight life pension actuarially reduced in accordance with an Option I election.

DUTY DEATH-IN-SERVICE SURVIVOR'S PENSION

Payable upon the expiration of Worker's Compensation to the survivors of a member who died in the line of duty.

Same amount that was paid by Worker's Compensation.

NON-DUTY DISABILITY

Payable upon the total and permanent disability of a member with 5 or more years-of-service.

To age 55: 1.5% of AFC times years of service. At age 55: Same as Service Retirement Pension.

DUTY DISABILITY

Payable upon the total and permanent disability of a member in the line of duty.

To age 55: 50% of AFC.
At age 55: Same as Service Retirement Pension

with service credit from date of disability to age

55.

MEMBER CONTRIBUTIONS

Amounts are described on page B-2.

Summary of Benefit Provisions as of June 30, 2018

	No.	GRS		Benefit	Maximum	Years In	Member Contribution
Group	People	Code	Eligibility	Multiplier*	Benefit	FAC	Rate
Police:							
Sergeants - POLC	17	91	25 yrs. of service or age 60	3.0%/1.0%	80% of FAC	3	11.72%
Lieutenants	4	90	25 yrs. of service or age 60	3.0%/1.0%	80% of FAC	3	10.00%
POLC	81	92	25 yrs. of service or age 60	3.0%/1.0%	80% of FAC	5	8.25%
Non-Represented	5	95,97	25 yrs. of service or age 60	3.0%/1.0%	80% of FAC	3	10.00%
Fire:							
OSP	3	94	age 50 and 25 yrs. or age 60	3.0%/1.0%	80% of FAC	3	10.00%
IAFF	74	93	25 yrs. of service or age 60	3.0%/1.0%	80% of FAC	3	11.04%
Non-Represented	1	98	25 yrs. of service or age 60	3.0%/1.0%	80% of FAC	3	10.00%
Total	185						

^{*} First multiplier applies to the first 25 years of service. Second multiplier applies to service greater than 25 years.

Note: None of the above groups are covered by Social Security. Employee contributions are made on a pre-tax basis.

Summary of Benefit Provisions as of June 30, 2018

DEFERRED RETIREMENT OPTION PLAN (DROP)

Effective July 1, 2016, Police Lieutenants and Firefighter IAFF and members with credited service between 25 and 30 years may participate in the Deferred Retirement Option Plan for a maximum participation period of five years. The benefit amount is the participant's accrued benefit at the date of DROP election. DROP benefits are credited monthly and DROP interest is credited quarterly to a DROP account at the rate of 2% annually. Employer and employee contributions will continue while the member participates in the DROP. Employer and employee contributions are not deposited in the DROP account. Upon actual retirement, the participant may elect a lump sum distribution of the DROP Account or direct rollover to a qualified plan.

[@] Net of health reserve.

The calculation of realized gains and losses is independent of the calculation of appreciation (depreciation) in the fair value of plan investments. Unrealized gains and losses in investments sold in the current year that had been held for more than one year were included in the net appreciation (depreciation) reported in the prior years and the current year.

Allocation of Employer Assets between Pension and Health

^{*} Reported payroll. Beginning in 1980, payroll was projected by a factor of 1.07 to approximate the relationship between gross payroll and the reported base payroll. Beginning in 1987, gross payroll was reported and no projection was necessary.

Active Members as of June 30, 2018 Expected Terminations by Type in Future Years

This chart shows the expected future development of the present population in simplified terms. The Retirement System presently covers 185 active members. 91% of the present population is expected to receive monthly retirement benefits either by retiring directly from active service, or by retiring from vested deferred status. 4% of the present population is expected to die or become disabled and receive a benefit. 5% of the present population is expected to terminate employment and forfeit eligibility for an employer provided benefit.

Active Members as of June 30, 2018 by Attained Age and Years of Service

SECTION C

FINANCIAL PRINCIPLES, ACTUARIAL VALUATION PROCESS,
ACTUARIAL COST METHODS, ACTUARIAL ASSUMPTIONS AND
DEFINITIONS OF TECHNICAL TERMS

Basic Financial Principles and Operation of the Retirement System

Benefit Promises Made Which Must Be Paid For. A retirement program is an orderly means of handing out, keeping track of, and financing pension promises to a group of employees. As each member of the retirement program acquires a unit of service credit the member is, in effect, handed an "IOU" which reads: "The Retirement System promises to pay you one unit of retirement benefits, payments in cash commencing when you retire."

The principal related financial question is: When shall the money required to cover the "IOU" be contributed? This year, when the benefit of the member's service is received? Or, some future year when the "IOU" becomes a cash demand?

The Constitution of the State of Michigan is directed to the question:

"Financial benefits arising on account of service rendered in each fiscal year shall be funded during that year and such funding shall not be used for financing unfunded accrued liabilities."

This Retirement System meets this requirement by having as its financial objective the establishment and receipt of contributions, expressed as percents of active member payroll, which will remain approximately level from year-to-year and will not have to be increased for future generations of taxpayers.

Translated into actuarial terminology, a level percent-of-payroll contribution objective means that the contribution rate must be at least:

Normal Cost (the present value of future benefits assigned to members' service being rendered in the current year)

. . . plus . . .

Interest on the Unfunded Actuarial Accrued Liability (the difference between the actuarial accrued liability and current System assets).

The accumulation of invested assets is a by-product of level percent-of-payroll contributions, not the objective. Investment income becomes the third major contributor to the retirement program, and the amount is directly reacted to the amount of contributions and investment performance.

If contributions to the retirement program are less than the preceding amount, the difference, plus investment earnings not realized thereon, will have to be contributed at some later time, or, benefits will have to be reduced, to satisfy the fundamental fiscal equation under which all retirement programs must operate:

$$B = C + I - E$$

The aggregate amount of Benefit payments to any group of members and their beneficiaries cannot exceed the sum of:

The aggregate amount of Contributions received on behalf of the group

. . . plus . . .

Investment earnings on contributions received and not required for immediate cash payments of benefits

. . . minus . . .

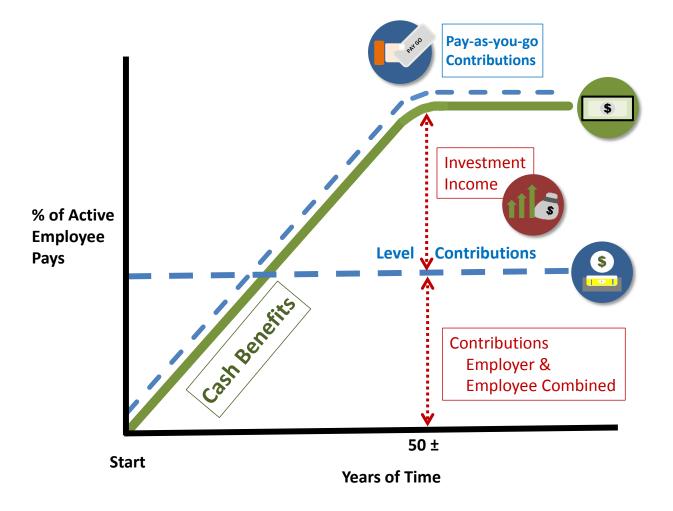

The Expenses of operating the program.

There are retirement programs designed to defer the bulk of contributions far into the future. The present contribution rate for such systems is *artificially low*. The fact that the contribution rate is destined to increase relentlessly to a much higher level, is often ignored.

This method of financing is prohibited in Michigan by the state constitution.

Computed Contribution Rate Needed To Finance Benefits. From a given schedule of benefits and from the data furnished, the actuary calculates the contribution rate **by means of an actuarial valuation** - the technique of assigning monetary values to the risks assumed in operating a retirement program.

CASH BENEFITS LINE. This relentlessly increasing line is the fundamental reality of retirement plan financing. It happens each time a new benefit is added for future retirements (and happens regardless of the design for contributing for benefits).

LEVEL CONTRIBUTION LINE. Determining the level contribution line requires detailed assumptions concerning a variety of experiences in future decades, including:

Economic Risk Areas

Rates of investment return
Rates of pay increase
Changes in active member group size

Non-Economic Risk Areas

Ages at actual retirement
Rates of mortality
Rates of withdrawal of active members (turnover)
Rates of disability

The Actuarial Valuation Process

The financing diagram on the previous page shows the relationship between the two fundamentally different philosophies of paying for retirement benefits: the method where contributions match cash benefit payments (or barely exceed cash benefit payments, as in the Federal Social Security program) which is an **increasing contribution method**; and the **level contribution method** which equalizes contributions between the generations.

The actuarial valuation is the mathematical process by which the level contribution rate is determined, and the flow of activity constituting the valuation may be summarized as follows:

- A. **Covered Person Data**, furnished by plan administrator
 Retired lives now receiving benefits
 Former employees with vested benefits not yet payable
 Active employees
- B. + Asset data (cash & investments), furnished by plan administrator
- C. + **Assumptions concerning future financial experience in various risk areas,** which assumptions are established by the Retirement System after consulting with the actuary
- D. + **The funding method** the employer contributions (the long-term, planned pattern for employer contributions)
- E. + Mathematically combining the assumptions, the funding method, and the data
- F. = Determination of:

Plan financial position and/or New Employer Contribution Rate

Actuarial Cost Methods Used for the Valuation

Age and Service Benefits. Normal cost and the allocation of actuarial present values between service rendered before and after the valuation date were determined using an individual entry-age actuarial cost method having the following characteristics:

- (i) the annual normal costs for each individual active member (usually expressed as a percent-of-payroll), payable from the member's date of hire to the member's projected date of retirement, are sufficient to accumulate the actuarial present value of the member's projected benefit at the time of retirement;
- (ii) the actuarial accrued liability under this method is equal to the assets which would have been accumulated had the normal cost contribution been made from the date of entry to the date of the valuation and had all actuarial assumptions been realized.

Casualty Benefits. Normal cost contributions were determined using a one-year term cost method. This method produces contributions sufficient to fund the value of (i) disability benefits likely to be incurred during the year (net of the member's accrued age and service benefits), and (ii) survivor benefits likely to be incurred during the year because of a member's death while employed.

Funding Value of Assets. The funding value of assets is derived as follows: prior year valuation assets are increased by contributions and expected investment income and reduced by refunds and benefit payments. To this amount is added 20% of the difference between expected and actual investment income for each of the previous five years. Funding value of assets may not be less than 80% nor more than 120% of market value.

Amortization of Unfunded Actuarial Accrued Liabilities. Unfunded actuarial accrued liabilities were amortized by level percent-of-payroll contributions (principal and interest combined) over periods described on page C-6.

Active member payroll was assumed to increase 4.00% per year for the purpose of determining the level percent contributions. Characteristics of this method of amortization are illustrated on page C-6.

Schedule of Amortizations for Development of Employer Contribution Rates Attributable to Actuarial Gains and Losses and Changes

Year Established	Initial Years	Years Remaining	Initial Amount	Previous Amount	Current Amount	Amortization Factor	Payment	Previous Payment	Percent-of- Payroll
	Lettel He forested								
2018	Initial Unfunded	26			\$25,759,166	19.0234	\$1,354,081		9.09%
					+ ,,		<i>+-,</i> ,,		0.007.5
	5 (1) (1)

2018	30	30	(111,600)	0	(111,600)	21.0413	(5,304)	0	(0.04)%
	Actuarial Cost Meth	ods/Assumption:	<u>s</u>						
2009	30	21	1,503,821	1,704,894	1,719,139	16.1948	106,154	101,582	0.71%
2015	30	27	6,841,876	7,087,389	7,200,438	19.5360	368,572	353,547	2.47%
2017	30	29	4,645,879	4,645,879	4,719,963	20.5547	229,630	220,798	1.54%

This schedule is maintained to arrive at the amortization amount shown on page A-2.

Actuarial Assumptions in the Valuation Process

Contribution requirements and actuarial present values for a retirement system are computed by applying actuarial assumptions to the benefit provisions and member data of the system, using the actuarial cost methods described on page C-5.

The principal areas of risk which require assumptions about future experience are:

- (i) long-term rates of investment return to be generated by the assets of the system.
- (ii) patterns of pay increases to members.
- (iii) rates of mortality among members, retirees and beneficiaries.
- (iv) rates of withdrawal of active members.
- (v) rates of disability among active members.
- (vi) the age patterns of actual retirements.

In making a valuation, the monetary effect of each assumption is computed for as long as a present covered person survives - - a period of time which can be as long as a century.

The employer contribution rate has been computed to remain level from year to year so long as benefits and the basic experience and make-up of members do not change. Examples of favorable experience which would tend to reduce the employer contribution rate are:

- (1) Investment returns in excess of 6.50% per year.
- (2) Member non-vested terminations at a higher rate than outlined on page C-12.
- (3) Mortality among retirees and beneficiaries at a higher rate than indicated by the RP-2014 Standard Mortality Tables Projected to 2019 using the MP-2014 mortality improvement scale.
- (4) Increases in the number of active members.

Examples of unfavorable experience which would tend to increase the employer contribution rate are:

- (1) Pay increases in excess of the rates outlined on page C-9.
- (2) An increase in the rate of retirement over the rates outlined on page C-13.
- (3) A pattern of hiring employees at older ages than in the past.

Actuarial Assumptions in the Valuation Process (Concluded)

Actual experience of the System will not coincide exactly with assumed experience, regardless of the choice of the assumptions, the skill of the actuary and the precision of the calculations. Each valuation provides a complete recalculation of assumed future experience and takes into account all past differences between assumed and actual experience. The result is a continual series of adjustments (usually small) to the computed contribution rate.

From time to time one or more of the assumptions is modified to reflect experience trends (but not random or temporary year-to-year fluctuations).

Actuarial Assumptions Used for the Valuation

Investment Return (net of administrative expenses).

6.50% per year, compounded annually. This rate consists of a real rate of return of 2.50% a year plus a long-term rate of wage growth of 4.00% a year. There is no specific assumption about price inflation needed for this valuation. The assumptions made would be consistent with a price inflation assumption of 2.75%.

This assumption is used to equate the value of payments due at different points in time and was first used for the June 30, 2017 valuation. Approximate rates of investment return, for the purpose of comparisons with assumed rates, are shown below:

	Year Ended June 30					
	2018	2017	2016	2015	2014	
Rate of Investment Return	6.8 %	7.3 %	6.1 %	8.8 %	10.2 %	

The nominal rate of return was computed using the approximate formula i = I divided by 1/2 (A + B - I), where I is recognized investment income net of expenses, A is the beginning of year asset value, and B is the end of year asset value.

These rates of return should not be used for measurement of an investment advisor's performance or for comparisons with other systems -- **to do so will mislead**.

Pay Projections. These assumptions are used to project current pays to those upon which benefits will be based. The assumptions were first used for the June 30, 2015 valuation.

Sample Years of	Annual Rate of F	Pay Increase for Sample	Years of Service
Service at Beginning	Base	Merit &	
of the Year	(Economic)	Longevity	Total
0	4.00%	12.00%	16.00%
1	4.00%	9.00%	13.00%
2	4.00%	4.30%	8.30%
3	4.00%	3.50%	7.50%
4	4.00%	2.30%	6.30%
5	4.00%	2.00%	6.00%
6	4.00%	1.00%	5.00%
7	4.00%	1.00%	5.00%
8	4.00%	1.00%	5.00%
9 and over	4.00%	0.50%	4.50%
Ref.		299	

Actuarial Assumptions Used for the Valuation (Continued)

If the number of active members remains constant, the total active member payroll and the average pay will increase 4.00% annually, the base portion of the individual pay increase assumptions. This increasing payroll was recognized in amortizing unfunded actuarial accrued liabilities.

Changes actually experienced in average pay and total payroll have been as follows:

	Year Ended June 30						
	2018 2017 2016 2015 2014						Average
Average Pay	2.9 %	5.0 %	(0.2)%	3.8 %	4.6 %	2.6 %	3.2 %
Total Payroll	0.8 %	5.5 %	(0.2)%	6.6 %	8.2 %	2.0 %	4.1 %

Fire (OSP) members were assumed to be eligible for retirement after attaining age 50 with 25 or more years of service, or age 60 with 10 or more years of service. All others are eligible with 25 years of service at any age or at age 60 regardless of service.

These rates were first used for the June 30, 2009 valuation.

Service based rates for Fire IAFF were adjusted in conjunction with the adoption of the DROP and were first used for the June 30, 2017 valuation, and were incorporated with the introduction of the DROP for Police Lieutenants in the June 30, 2018 valuation.

Active Member Group Size. The number of active members was assumed to remain constant. This assumption is unchanged from previous valuations.

^{*} The probability of retirement at first eligibility for Fire (OSP) members is 60%.

Pensions in an Inflationary Environment

Value of \$1,000/month Retirement Benefit to an Individual Who Retires at Age 55 in an Environment of 2.75% Price Inflation

85	930	443	

The life expectancy of a 60-year-old male is to age 85. The life expectancy for a 60-year-old female is to age 87. Half of the people will outlive their life expectancy. The effects of even moderate amounts of inflation can be significant for those who live to an advanced age.

Miscellaneous and Technical Assumptions June 30, 2018

Marriage Assumption: 100% of males and 100% of females are assumed to be married

for purposes of death-in-service benefits. Male spouses are assumed to be three years older than female spouses. 80% of retirees are assumed to have a spouse eligible for the 60% death

after retirement survivor benefit.

Pay Increase Timing: Beginning of (Fiscal) year. This is equivalent to assuming that

reported pays represent amounts paid to members during the

year ended on the valuation date.

Decrement Timing: All decrements are assumed to occur at the middle of the year.

Eligibility Testing: Eligibility for benefits is determined using the age nearest

birthday and the service nearest whole year on the date the

decrement is assumed to occur.

Decrement Relativity: Decrement rates are used directly from the experience study,

without adjustment for multiple decrement table effects.

Decrement Operation: Disability and mortality decrements do not operate during the

first five years of service. Disability also does not operate during

retirement eligibility.

Normal Form of Benefit: The assumed normal form of benefit is the 60% joint and

survivor form.

Incidence of Contributions: Contributions are assumed to be received continuously

throughout the year based upon the computed percent-ofpayroll shown in this report, and the actual payroll payable at

the time contributions are made.

Approximation: Age and service benefits were increased by the following

percentages to account for lump sums included in final average pay at retirement: Police Officers: 5%. Police Lieutenants: 8%.

Police Sergeants, Fire OSP and IAFF: 8.33%.

Summary of Actuarial Methods and Assumptions

The information presented in the required supplementary schedules was determined as part of the actuarial valuations at the dates indicated. Additional information as of the latest actuarial valuation follows:

Valuation date June 30, 2018

Actuarial cost method Entry-age actuarial cost method

Amortization method Level percent-of-payroll

Remaining amortization period 30-year closed for benefit improvements

and assumption changes

26-year closed for all other liabilities

Asset valuation method 5-year smoothed market with 20%

corridor

Actuarial assumptions:

Investment rate of return 6.50%

Projected salary increases 4.00% - 16.00%

Assumed rate of payroll growth 4.00%

Assumed rate of membership growth 0%

Cost-of-living adjustments N/A

Definitions of Technical Terms

Accrued Service. Service credited under the system which was rendered before the date of the actuarial valuation.

Actuarial Accrued Liability. The difference between the actuarial present value of system benefits and the actuarial present value of future normal costs. Also referred to as "past service liability."

Actuarial Assumptions. Estimates of future experience with respect to rates of mortality, disability, turnover, retirement, rate or rates of investment income and salary increases. Decrement assumptions (rates of mortality, disability, turnover and retirement) are generally based on past experience, often modified for projected changes in conditions. Economic assumptions (salary increases and investment income) consist of an underlying rate in an inflation-free environment plus a provision for a long-term average rate of inflation.

Actuarial Cost Method. A mathematical budgeting procedure for allocating the dollar amount of the "actuarial present value of future benefit" between future normal cost and actuarial accrued liabilities. Sometimes referred to as the "actuarial funding method."

Actuarial Equivalent. One series of payments is said to be actuarially equivalent to another series of payments if the two series have the same actuarial present value.

Actuarial Gain (Loss). The difference between actual unfunded actuarial accrued liabilities and anticipated unfunded actuarial accrued liabilities -- during the period between two valuation dates. It is a measurement of the difference between actual and expected experience.

Actuarial Present Value. The amount of funds currently required to provide a payment or series of payments in the future. It is determined by discounting future payments at predetermined rates of interest, and by probabilities of payment.

Actuary. A person who is trained in the applications of probability and compound interest to problems in business and finance that involve payment of money in the future, contingent upon the occurrence of future events. Most actuaries in the United States are Members of the American Academy of Actuaries. The Society of Actuaries is an international research, education and membership organization for actuaries in the life and health insurance, employee benefits, and pension fields. It administers a series of examinations leading initially to Associateship and the designation A.S.A., and ultimately to Fellowship with the designation of F.S.A.

Amortization. Paying off an interest-discounted amount with periodic payments of interest and (generally) principal -- as opposed to paying it off with a lump sum payment.

Credited Projected Benefit. The portion of a member's projected benefit attributable to service before the valuation date - allocated based on the ratio of accrued service to projected total service and based on anticipated future compensation.

Normal Cost. The portion of the actuarial present value of future benefits that is assigned to the current year by the actuarial cost method. Sometimes referred to as "current service cost."

Definitions of Technical Terms (Concluded)

Unfunded Actuarial Accrued Liabilities. The difference between actuarial accrued liabilities and valuation assets. Sometimes referred to as "unfunded past service liability" or "unfunded supplemental present value."

Most retirement systems have unfunded actuarial accrued liabilities. They arise each time new benefits are added and each time an actuarial loss occurs.

The existence of unfunded actuarial accrued liabilities is not in itself bad, any more than a mortgage on a house is bad. Unfunded actuarial accrued liabilities do not represent a debt that is payable today. What is important is the ability to amortize the unfunded actuarial accrued liabilities and the trend in their amount (after due allowance for devaluation of the dollar).

Valuation Assets. The value of cash, investments and other property belonging to a pension plan, as used for the purpose of an actuarial valuation.
